Reference systems The GDB reference system is supported by AutoCAD LT and AutoCAD, allowing precise and efficient referencing from CAD geometry into the drawing. Rasterization Rasterization is the process of transforming a vector image to a raster image. Rasterization is the process of transforming a vector image into a bitmap image. A raster image is an image of pixels that is stored as a square matrix of data called a bitmap. It can be viewed as an array of "black" and "white" pixels. In vector graphics, rasterization can be performed in three ways: Transforming a vector image (that is, an image defined by a geometric object) into a raster image that contains a similar, yet different, representation of the same image. This is used for example to do 2D printing, or to create a screen rasterization of a 3D geometry (for 3D printing, or further 2D display). Using rasterization to simply put a logo in a CAD drawing. Using rasterization to simulate a vector image to be displayed on a monitor or a printer. This is used for example, to create an EPS rasterization of a 3D model or a bitmap (a bitmap is the simplest rasterization method). A commonly used rasterization technique for generating the bitmap of a rasterized image is a screen rasterization. Rasterization to create a bitmap image is the method used by almost all CAD programs.
